-- 42. The device of claim 40, including a portion \$165 354-359 projecting from said component through said head, said portion \$171-173 functioning to transmit loads imposed on said reciprocatable component. --

FIGS 354,357 -- 43. The device of claim 42, wherein said portion is PP 171-173 a shaft. --

-- 44. The device of claim 43, wherein said shaft

F165 354,357

PP 171- 173

defines at least one internal conduit for the passage of working
fluid. --

-- 46. The device of claim 40, wherein said chamber has internal circumferential depressions and said component has external circumferential projections reciprocatable in said depressions, said depressions and projections having working surfaces which together form at least one torroidal fluid working chamber which in operation has a cyclically variable volume. --

-- 47. The device of claim 42, wherein said chamber has internal circumferential depressions and said component has external circumferential projections reciprocatable in said depressions, said depressions and projections having working surfaces which together form at least one torroidal fluid working chamber which in operation has a cyclically variable volume. --

-- 48. The device of claim 40, including a housing for said chamber, head and component, said chamber, head and component being rotatably mounted within said housing to enable said chamber assembly to rotate within said housing while said component reciprocates within said assembly. --

FIGS 354-359 PP 171 - 173

F165 354-359

PP 171-173

FIG 397 PP 191-192 FIGS 354-359 PP 171-173

-- 49. A device for the working of fluids, said device having a cylinder assembly comprising a cylinder with internal circumferential depressions, a component with external circumferential projections and at least one structural member, said external circumferential projections reciprocating in said internal circumferential depressions and both having working surfaces defining at least one pair of torroidal fluid working chambers which in operation have cyclically variable volumes, said at least one structural member having working surfaces mounted internally of said cylinder on said component and having the function of transmitting load imposed by the working surfaces. --

F165 354-359 PP 171-173

-- 50. The device of claim 49, wherein said component defines an internal passage for passage of fluids to or from said working volume, said working volume being separated from and pierced by said passage. --

PP 171 -173

-- 51. The device of claim 50, wherein said component F165 354-359 defines a port communicating with said passage and said working volume during only a portion of the reciprocation cycle of said component. --

F165 354 357 PP171-173

-- 52. The device of claim 49, wherein said structural member is a shaft. --

FIGS 354-357 PP 171-173

-- 53. The device of claim 52, wherein said shaft defines at least one internal conduit for the passage of working fluid. --

FIL 397 PP171-173

-- 54. The device of claim 49, including a housing for said cylinder assembly, said cylinder assembly mounted within said housing to enable said assembly to rotate while said component reciprocates within said assembly. --IN THE TITLE:
